

Comparing Overwatch® Herbicide to Propyzamide Herbicides in Canola

Due to supply constraints of internationally sourced propyzamide technical, Rustler® Herbicide volumes could be limited for the start of the 2022 winter cropping season. Being a lead supplier of propyzamide with Rustler® Herbicide, FMC is informing the Australian market about this shortage so that Canola growers can plan accordingly.

As FMC produces Isoflex® technical and formulates locally, Overwatch® Herbicide is expected to be in good supply. With its flexible use in Wheat, Barley and Canola, Overwatch® Herbicide makes an excellent alternative to propyzamide in Canola growers' herbicide programs.

Key Points:

- ✓ Overwatch® Herbicide provides market leading Annual ryegrass control[^] in Canola with the unique Group 13/Q mode of action
- ✓ Overwatch® Herbicide can be used in all Canola herbicide systems with complimentary weed activity to each system's recommended herbicides
- ✓ With a zero day plant back interval to Wheat and Barley, the use of Overwatch® Herbicide provides replant options if Canola does not successfully establish due to pest, disease or climatic conditions.

Product Comparison:	Overwatch® Herbicide	Rustler® Herbicide
Active Constituent	400 g/L Bixlozone	500 g/L Propyzamide (Rustler®); 900 g/kg Propyzamide (Rustler® 900)
Formulation	Suspension Concentrate (SC)	Water dispersible granule (WG) and Suspension Concentrate (SC)
Group (formerly MOA)	Group 13 (Q)	Group 3 (D)
*Registered Crops:		
Wheat, Barley	✓	
Canola	✓	✓
Faba beans	**** Registration pending	✓
Field Peas	**** Registration pending	✓
